Sequence 17295, Application US/09252991A

Factor No. 6551795

GENERAL INFORMATION:
TITLE OF INVENTION: WICLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS

TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS

FILE REPERENCE: 107196.136

CURRENT PILING DATE: 1999-02-18

CURRENT PILING DATE: 1998-02-18

PRIOR APPLICATION NUMBER: US 60/094,190

PRIOR FILING DATE: 1998-07-27

NUMBER OF SEQ ID NOS: 33142

SEQ ID NO 17295

LENGTH: 494

TYPE: RET

CREANISM: Pseudomonas aeruginosa

Sequence 28291, Application US/09252991A

Patent No. 6551795

GENERAL INFORMATION:
APPLICANT: Marc J. Rubenfield et al.
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS
TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
FILE REFERENCE: 107196.136
CURRENT FILING DATE: 1999-02-18

PRIOR APPLICATION NUMBER: US 60/074,788
PRIOR PRILING DATE: 1998-02-18
PRIOR FILING DATE: 1998-02-18
PRIOR FILING DATE: 1998-07-27
NUMBER OF SEQ ID NOS: 33142
SEQ ID NO 28291
LENGTH: 528

i Sequence 24, Application US/08426627

j Patent No. 575664

i GENERAL INFORMATION:

APPLICANT: Amann, Egon
APPLICANT: Takeshita, Suna
APPLICANT: Takeshita, Suna
APPLICANT: Tezuka, Kenichi
TITLE OF INVENTION: No. 5756664el Protein with Bone Formation
TITLE OF INVENTION: Ability and Process for Its Production.

NUMBER OF SEQUENCES: 24
CORRESPONDENCE ADDRESS:
ADDRESSEE: Finnegan, Henderson, Farabow, Garrett & ADDRESSEE: Dunner

```

Determination of an agent capable of inhibiting aggregation of alpha

```
ö
synuclein useful for treating a neurodegenerative disease involves determining aggregation of alpha synuclein in the presence of exogenous iron or copper
                                                                            relates to screening of inhibitors of alpha-synuclein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell interactions -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins
(ABB57737-ABB72072).
                                                                                                                                                         , Alzheimer's
                                                                                                       aggregation in the presence of exogenous iron or copper. The inhibitor are magnesium and alpha-synuclein binding peptides, which are useful for treating neurodegenerative disease that involves the formation of Lewy bodies e.g. Parkinson's disease (PD), Alzheimer'disease (AD), diffuse Lewy body disease, mixed AD-PD, multiple system atrophy and Hallervorden-Spatz disease. The present sequence is a peptide that binds to the NAC (non-amyloid-beta protein component) portion of human alpha-synuclein and inhibits its aggregation.
                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Drosophila, developmental biology; cell signalling; insecticide; pharmaceutical.
                                                                                                                                                                                                                                                                                                                   í

Sequences ABP31028-ABP35561 represent 4534 novel human proteins designated ORF (open reading frame) 1-4534, and sequences ABN75054-ABN79587 represent cDNAs encoding them. The invention also encompasses polypeptides at least 80% identical to the ORF1-ORF4534 (collectively referred to as ORFX) proteins, polymucleotides at least 85% identical to the ORFX nucleic acid sequences, vectors and host cells comprising ORFX polymucleotides, the recombinant production of ORFX proteins, antibodies specific for ORFX proteins, methods of screening for modulators of ORFX expression or activity, and methods of screening individuals for a predisposition to an ORFX-associated disorder. The ORFX proteins of the invention have a wide
                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; ORF; open reading frame; ORFX; drug screening; diagnosis; disease monitoring; cytokine; cell proliferation; cell differentiation; immune modulation; haematopoiesis regulation; tissue growth; angiogenesis; activin; inhibin; chemotactic; chemokinetic; haemostatic; thrombolytic; tumour inhibition; bodily characteristic; fertility; behaviour; cancer; proliferative disorder; neurological disorder; cardiovascular disease; immune system disorder; organ transplantation; tissue growth disorder; tissue regeneration disorder; diabetes mellitus; hypothyroidism; cholesterol ester storage disease; infection; vulnerary; vasotropic; antipsoriatic; antidiabetic; cytostatic; nootropic; neuroprotective; antiatherosclerotic; anticoagulant; thrombolytic; cardiant, hypotensive; antithyroid; antiinflammatory; immunomodulator; cardiant; hypotensive; virucide; antiinflammatory; immunomodulator;
specification, but was obtained in electronic format directly from WIPO

range of biological activities, such as cytokine, cell proliferation, cell differentiation, immune modulation, haematopoiesis regulation, tissue growth, angiogenesis, activin or inhibin activity, chemicactic/ chemokinetic activity, haemostatic activity, thrombolytic activity, and may also be involved in the determination antiinfective activity, and may also be involved in the determination of bodily characteristics, fertility and behaviour. ORFX proteins, other proliferative disorders much as psoriasis and benign tumours, conter proliferative disorders such as psoriasis and benign tumours, content proliferative disorders such as epilepsy and Alzheimer's disease, neurological disorders such as epilepsy and Alzheimer's disease, cardiovascular diseases, immune system disorders, disorders related to cardiovascular diseases, immune system disorders, disorders related to cardiovascular diseases, immune system disorders, disorders related to cardiovascular diseases, include diseases caused by viral, bacterial, disorder may also be used as a source of primers and infectious diseases caused by viral, bacterial, content of primers and probes, in the detection of ORFX genomic sequences, in genetic diagnosis, and in forensic biology. The ORFX uncleic acids may additionally be used to produce transgenic animals content, and in drug screening. The ORFX proteins may also be used as immunogens to generate specific antibodies, which are useful in the diagnosis, treatment and monitoring of ORFX-associated diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, oplymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The crientifying expressed genes. (I) is useful in gene therapy techniques or identifying expressed genes. (I) is useful in gene therapy techniques (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical cilsorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and damostic amino acid sequences of the invention.

CC amino acid sequences ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention.

Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at the print of at the wipo.int/published_potl_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             treatment and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Buchrieser C, Frangeul L, Couve E, Rusniok C, Fsihi H, Dehoux P; Dussurget O, Chetouani F, Nedjari H, Glaser P, Kunst F, Cossart Daniels J, Goebel W, Kreft J, Kuhn M, Ng E, Vazquez-Boland JA; Dominguez-Bernal G, Garrido-Garcia P, Tierrez-Martinez A, Amend A; Chakraborty T, Domann E, Hain T, Berche P, Charbit A, Durant L; Perez-Diaz J, Baquero F, Garcia Del Portillo F, Gomez-Lopez N; Maduenio E, De Pablos B, Wehland J, Kaerst U, Entian K, Hauf J;

The present invention relates to the genome sequence of Listeria
monocytogenes EGD-e (see ABA03041). The genome sequence and fragments of
it are useful for selecting probes and primers for detecting genes in L.
monocytogenes and related organisms, and for studying genetic
controlled by the genome sequence of the present invention. Proteins
encoded by the genome sequence are useful for raising specific
antibodies, identification of L. monocytogenes and related organisms, and
for biosynthesis and biodegradation, especially biosynthesis of Vitamin
B12. The genome sequence and proteins encoded by it are also useful for
selecting compounds that regulate gene expression and cell replication
cand modulate L. monocytogenes-related diseases. In addition, the genome
and modulate L. monocytogenes-related diseases. In addition, the genome
cand modulate by it are useful in pharmaceutical and
vaccines compositions for the treatment or prevention of infections by L.
monocytogenes and related organisms.
Note: The sequence data for this patent did not form part of the printed
specification, but was obtained in electronic format directly from WIPO

Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by P. acnes. The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis. P. acnes is also involved in infections of bone, joints and the central nervous associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies specific for P. acnes proteins. These antibodies can be used to downregulate expression and activity of P. acnes polypeptides may also be used as diagnostic agents for determining P. acnes presence, for example, by enzyme linked immunosorbent assay (ELISA).

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO specification, but was obtained in electronic format directly from WIPO
        immunogenic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to isolated polymuclectide (I) and polypeptide \langle II \rangle sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                .

and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving an unitating a polypeptide in tissue, as molecular weight markers and as quantitating a polypeptide in tissue, as molecular weight markers and as a maging of sites expressing (II). (I) and (II) are useful in medical inaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations and to produce other types of data and products dependent on DNA and amino acid sequences of the invention.

Once: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at figures.

Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by the treatment, prevention and diagnosis of medical conditions caused by a cones. The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hypertosis and osteomyellis), uveitis and endophthalmitis. P. acnes is also involved in infections of, joints and the central carrous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting to ample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies and charming the acnes proteins. These antibodies can be used to downregulate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used as therefore treat P. acnes infections. The antibodies may also be used as charmed linked immunosorbent assay (BLISA).

Consyme linked immunosorbent assay (BLISA).

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp. wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                        Propionibacterium acnes polypeptides and nucleic acids useful for vaccinating against and diagnosing infections, especially useful treating acne vulgaris -
                                                                                                                                                                                                                                                                                                                                  Ä

Pollock V.V., Barber M.J.;

"Molecular cloning and expression of biotin sulfoxide reductase from Rhodobacter sphaeroides forma sp. denitrificans.";

Arch. Biochem. Biophys. 318:322-332(1995).

-!- FUNCTION: THIS ENZYME MAY SERVE AS & SCAVENGER, ALLOWING THE CELL TO UTILIZE BIOTIN SULFOXIDE AS A BIOTIN SOURCE. IT REDUCES A SPONTANBOUS OXIDATION PRODUCT OF BIOTIN, D-BIOTIN D-SULFOXIDE (BSO OR BDS), BACK TO BIOTIN (BY SIMILARITY).

-!- COFACTOR: MOLYBDENUM (MOLYBDOPTERIN).

-!- SIMILARITY: BELONGS TO THE PROKARYOTIC MOLYBDOPTERIN-CONTAINING OXIDOREDUCTASE FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               entry is copyright. Jedd G., Chua N.-H.;

T a new self-assembled peroxisomal vesicle required for efficient

resealing of the plasma membrane.";

I Nat. Cell Biol. 2:226-231(2000).

-!- FUNCTION: Major protein in the hexagonal crystals of Woronin

c bodies, a peroxisomal vesicle that seal the septal pore in

response to cellular damage.

-!- SUBUNIT: Forms oligomers. Self-assemble into hexagonal rods (By similarity).

c:- SUBCELLULAR LOCATION: Peroxisomal. Woronin bodies.

-!- SUBCELLULAR LOCATION: Peroxisomal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   MICROBODY TARGETING SIGNAL (POTENTIAL) 567634BFA7A62C93 CRC64;

The genome of invasive Streptococcus pyogenes; a comparative analysis
of S. pyogenes SSI-1, SF370 and MGAS8232.";
Submitted (MAY-2002) to the EMBL/GenBank/DDBJ databases.

C.: FUNCTION: First step of the lipid cycle reactions in the biosynthesis of the cell wall peptidoglycan (By similarity).

C.: CATALYTIC ACTIVITY: UDFMur2Ac(oyl-L-Ala-gamma-D-Ala-D-Ala-D-Ala)-diphosphoundecaprenol.

Glu-L-Lys-D-Ala-D-Ala)-diphosphoundecaprenol.

C.: PATHWAY: Peptidoglycan biosynthesis.

C.: PATHWAY: Peptidoglycan biosynthesis.

PATHWAY: Peptidoglycan biosynthesis.
SUBCELLULAR LOCATION: Integral membrane protein (By similarity)
SIMILARITY: Belongs to the glycosyltransferase family 4. MraY
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 "Genome sequence of a serotype M3 strain of group A Streptococcus:
phage-encoded toxins, the high-virulence phenotype, and clone
emergence.";

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        RESULT 4

A40262
transcription initiation factor IID 250K chain splice form 1 - human
NyAlternate names: 210K nuclear DNA-binding cell cycle gene 1 protein (CCG1); TA
NyContains: transcription initiation factor IID 250K chain splice form 2
C;Species: Homo sapiens (man)
C;Daccession: A40262; S03005; S03050; S32352; S32353

Sequence 22036, Application US/09252991A
Patent No. 6551795
GENERAL INFORMATION:
APPLICANT: Marc J. Rubenfield et al.
APPLICANT: Marc J. Rubenfield et al.
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS
TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
FILE REFERENCE: 107196.136
CURRENT APPLICATION NUMBER: US 60/094,788
PRIOR PILING DATE: 1999-02-18
PRIOR PILING DATE: 1998-07-27
NUMBER OF SEQ ID NOS: 33142
SEQ ID NO 22036
LENGTH: 580
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          .;

Sequence 4, Application US/08227536;
Patent No. 5658784
GENERAL INFORMATION:
APPLICANT: Even, Mark
APPLICANT: Livingston, David
TITLE OF INVENTION: WUCLEIC ACID, ENCODING TRANSCRIPTION
TITLE OF INVENTION: FACTOR P300 AND USES OF P300
NUMBER OF SEQUENCES: 13
CORRESPONDENCE ADDRESS:
ADDRESSEE: Weingarten, Schurgin, Gagnebin & Hayes
STREET: Ten Post Office Square
CITY: Boston
STATE: MA
COUNTRY: US
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ore 45; DB 4; Length 580;

Sequence 160, Application US/09461325A
Patent No. 6475753
GENERAL INFORMATION:
APPLICANT: Ruben et al.
TITLE OF INVENTION: 94 Human Secreted Proteins
FILE REFERENCE: PZ029H
CURRENT FILING DATE: 1999-12-14
EARLIER APPLICATION NUMBER: DCT/US99/13418
EARLIER FILING DATE: 1999-06-15
EARLIER FILING DATE: 1999-06-15

                                                                                                   The invention relates to screening of inhibitors of alpha-synuclein aggregation in the presence of exogenous iron or copper. The inhibitors are magnesium and alpha-synuclein binding peptides, which are useful for treating neurodegenerative disease that involves the formation of Lewy bodies e.g. Parkinson's disease (PD), Alzheimer's disease (AD), diffuse Lewy body disease, mixed AD-PD, multiple system atrophy and Hallervorden-Spatz disease. The present sequence is a peptide that binds to the NAC (non-amyloid-beta protein component) portion of human alpha-synuclein and inhibits its aggregation.
synuclein useful for treating a neurodegenerative disease involves
determining aggregation of alpha synuclein in the presence of exogenous
iron or copper
                                                                                                                                                                                                                                                                                                               Gaps

```
The present sequence represents a plant transcription factor protein which modifies the flowering time of a plant. The polynucleotide sequence is used to produce transgenic plants which have a modified flowering time or a modified vernalisation requirement. The polynucleotides and polypeptides are useful for modifying plant development, physiology or biochemistry such that the modified plants have a trait advantage over wild type plants. In particular they are useful for accelerating, delaying or preventing flowering. The polynucleotides are also useful as nucleic acid probes and primers. They may be used to identify proteins that can modify the activity of the transcription factor.
                      Transcription factor; flowering time; transgenic plant; vernalisation; plant development; plant physiology; flowering.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New transgenic plant comprises a recombinant polynucleotide encoding plant transcription factor polypeptide and has a modified flowering time or vernalization requirement -

                                                                                                                                                                                                                                                                                                   The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABB57737-ABB72072)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ; cell proliferation; cell differentiation; gene therapy; le therapy; stem cell growth factor; haematopoiesis; sactor; immunomodulatory; cancer; leukaemia; disorders; arthritis; inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                        r detecting 1000 or more signalling and cell-cell

                                               The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AA000010-AA013910) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polyneptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and
                                                                                                                                                                                                                                                                                                                                                                                               Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human, secreted protein, cancer, tumour, developmental abnormality, foetal deficiency; blood disorder, immune system disorder, inflammation, autoimmune disease, allergy, Alzheimer's disease, cognitive disorder; schizophrenia, arthritis, asthma; psoriasis; sepsis; skin disorder; atherosclerosis, diabetes; cardiovascular disorder; kidney disorder; digestive disorder; endocrine disorder; infection; AIDS; leukaemia; therapy.

```
AAZ97019 to AAZ97137 represent 94 isolated human secreted protein genes.
AAX86215 to AAY86333 are the secreted proteins encoded by the 94 human gares. This sequence represents a fragment of one of the human secreted proteins. The genes and their corresponding secreted polypeptides are useful for preventing, treating or ameliorating medical conditions, e.g., by protein or gene therapy. Also pathological conditions can be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new genes. Specific uses are described for each of the 94 genes, based on which tissues they are most highly expressed in, and include developing products for the diagnosis or treatment of cancer, tumours, developmental abnormalities and foetal deficiencies, blood disorders, diseases of the immune system, autoimmune diseases, inflammation, allergies, Alzheimer's and cognitive disorders, atherosclerosis, diabetes, cardiovascular disorders, kidney disorders, digestive/endocrine disorders, infections and AIDS. The polypeptides are also useful for identifying their binding partners.

The sequences shown in AAY86334 to AAY86585 represent fragments of the

```

AAZ97019 to AAZ97137 represent 94 isolated human secreted protein genes.

AAY86215 to AAY8633 are the secreted proteins encoded by the 94 human genes. This sequence represents a fragment of one of the human secreted proteins. The genes and their corresponding secreted polypeptides are useful for preventing, treating or ameliorating medical conditions, e.g., by protein or gene therapy. Also pathological conditions can be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new genes. Specific uses are described for each of the 94 genes, based on which tissues they are most highly expressed in, and include developing products for the diagnosis or treatment of cancer, tumours, developmental abnormalities and foetal deficiencies, blood disorders, diseases of the immune system, autoimmune diseases, inflammation, allergies, Alzheimer's and cognitive disorders, atherosclerosis, diabetes, cardiovascular disorders, kidney disorders, digestive/endocrine disorders, infections and AIDS. The polypeptides are also useful for identifying their binding partners.

The sequences shown in AAY86334 to AAY86585 represent fragments of the

reventing bacillary dysentery in a mammal or human

81; 162pp; English

90

or

ע כ

The invention relates to a complex of protein-protein interactions between a Shigella flexneri polypeptide (e.g. ospB, ospD1, ipaD, ipaC, ipaH9.8, ospG and ospC1) and a mammalian polypeptide defined in the specification. The complexes are formed using the yeast two-hybrid system. Also included are (1) a recombinant host cell expressing the interactions between the Shigella flexneri polypeptide and a mammalian polypeptide defined in the Specification; (2) selecting a modulating compound that inhibits or activates the protein-protein interactions; (3) a modulating compound obtained from the method of (2); (4) a SID (selected interacting domain) polypeptide or its fragment or variant comprising the human polypeptides appearing as ABG70042-ABG70242; (5) a SID polynucleotide or its fragment or variant comprising the above polypeptides a vector comprising (5); (6) a recombinant host cell containing the vector; and (10) a protein chip comprising Shigella flexneri polypeptide and a mammalian polypeptide or polynucleotide is useful for treating or preventing shigellosis (bacillary dysentexy) in a human or mammal. The present sequence represents a human prey protein isolated by the shigella protein. Length 898; Score 40; DB 23; I Pred. No. 1.2e+02;); Mismatches 0; 898 AA; Sequence

Diagnosing breast cancer comprises determining expression of nucleic acid molecules or expression products that are differentially expressed in normal and malignant tissue

Claim 37; Page 2

The present invention relates to a method for diagnosing breast cancer in a subject suspected of having endometrial cancer. The method comprises determining the expression of a set of human genes or expression products in an endometrial sample suspected of being concerous. The human genes of the invention are differentially cancerous. The human genes can be used to low MAI (mitotic activity index). These sets of genes can be used to discriminate between continuty index). These sets of genes can be used to discriminate between protein microarrays for analysing the expression of the human genes and their protein products. The methods and arrays are useful for the diagnosis and prognosis of endometrial cancer, selecting and monitoring treatment regimes, and identification of compounds useful for the treatment of endometrial cancer. AAU84311-AAU84361 represent the human proteins of the invention that are differentially expressed in breast cancer tissue.

                                                            The invention relates to screening of inhibitors of alpha-synuclein aggregation in the presence of exogenous iron or copper. The inhibitors are magnesium and alpha-synuclein binding peptides, which are useful for treating neurodegenerative disease that involves the formation of Lewy bodies e.g. Parkinson's disease (PD), Alzheimer's disease (AD), diffuse Lewy body disease, mixed AD-PD, multiple system atrophy and Hallervorden-Spatz disease. The present sequence is a peptide that binds to the NAC (non-amyloid-beta protein component) portion of human alpha-synuclein and inhibits its aggregation.
synuclein useful for treating a neurodegenerative disease involves determining aggregation of alpha synuclein in the presence of exogenous iron or copper
                                                                                                                                                                                                                   Gaps

Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by P. acnes. The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis. P. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies
                                                                       ô

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins
                                                                                                                                                                                              ô
  specific for P. acnes proteins. These antibodies can be used to downregulate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used as diagnostic agents for determining P. acnes presence, for example, by enzyme linked immunosorbent assay (ELISA).

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ta for this patent did not form part of the printed but was obtained in electronic format directly from WIPO /pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      nucleic acid detection reagent for detecting 1000 or more rosophila and for elucidating cell signalling and cell-cell
                                                                                                                                                                                              Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABB57737-ABB72072).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaрв

Ö o£ The present invention is related to a Lactococcus lactis nucleotide sequence (ABA90521) and related proteins (ABB53300-ABB55621). The nucleic acid sequence is useful in the detection and/or amplification of nucleic acid sequence, particularly to identify Lactococcus lactis or related species. The proteins of the invention are useful for the biosynthesis or biodegradation of a composition of interest. The invention helps research in lactic bacteria, particularly useful in the production of yogurt and cheese.

Note: The sequence data for this patent is based on equivalent patent WO200177334 (published 18-OCT-2001) which is available in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences. Gaps New nucleotide sequence useful in the identification or Lactococcus lactis and related species -P119 gene; promoter; fruit-specific expression; transgenic plant; herbicide resistance; disease resistance; crop protection; tomato; tobacco. .; 0 odegradation; lactic bacterium; yogurt; cheese. 23; Length 91; 1; Indels Ehrlich SD; Query Match 80.0%; Score 36; DB Best Local Similarity 85.7%; Pred. Abscisic acid-inducible and stress responsive protein; ASR; A22; PKABA; stress-inducible cysteine protease; late embryogenesis abundant protein; LEA; dehydrin; DHN; abscisic acid-induced protein kinase; gene therapy; CYS; seed development; plant tolerance; germination; plant protectant;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New isolated nucleic acid encoding ASR, A22, CYS, LEA, DHN or PKABA proteins, useful as molecular genetic markers, and in modifying plant and/or seed development and responses to stresses and adverse environmental stimuli
                                                                                                                                                                                                                                                                                                                                                                                                                                               P119 (AAW02631) is the product of a novel gene (see also AAT32863) isolated from the pericarp of cherry tomato cv. Golden Nugget.
P119 mRNA is present at high levels in tomato pericarp (both mature and at various stages of ripening), at moderate levels in flowers and immature green fruit, at low levels in roots and stems, and is not present in leaves. The promoter (see also AAT32864) of the P119 gene can be used to express operably linked DNA sequences primarily in fruit tissue of transgenic plants, esp. tomato and tobacco.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            .;

The invention relates to nucleic acid encoding abscisic acid-inducible and stress responsive proteins (ASR and A22), stress-inducible cysteine proteases (CYS), late embryogenesis abundant proteins (LEA), dehydrins (DHN) and abscisic acid-induced protein kinases (PKABA). The invention also relates to a method for modification of plant and seed development and plant responses to stresses and stimuli. The invention is useful as molecular genetic markers. The method is useful for modifying plant response to an environmental stimulus, modifying plant tolerance to abiotic, osmotic and/or temperature stresses, modifying seed dormancy and/or germination, development, maturation, and modifying a plant tolerance and adaptation to stresses and adverse environmental stimuli. The invention is also used in gene therapy. The preset sequence is

I resistance to water stress, contains sense or encoding abscisic acid-water stress-ripening-induced Plant with improved antisense sequence protein -

Claim 3; Page 32; 42pp; French.

The present invention relates to a method for the preparation of a plant containing an altered amount of ASR protein (abscisic acid-water stress-ripening-induced protein). Plants with altered expression of ASR have increased resistance to water stress, relative to a non-transformed plant. The method is especially applied to crop plants such as maize (especially), wheat, rape, sunflower and peas to increase resistance to water stress. The present sequence is a protein sequence for maize ASR which was used to illustrate the present invention.

useful in Isolated nucleic acid sequences encoding elongase proteins, useful in the production of polyunsaturated fatty acids, e.g. arachidonic acid, which can then be used nutritional compositions and pharmaceutical compositions (for treating AIDS) -

66; 271pp; English. Example 21; Fig

The invention relates to isolated nucleic acid sequences encoding elongase proteins and the elongase proteins themselves. Also included are a purified polypeptide which elongates polyunsaturated fatty acids and has at least 30% amino acid similarity to the amino acid sequence to an elongase protein, a vector comprising the nucleic acid, a plant cell cor tissue or whole plant) comprising the vector and expressing the nucleic acid, a plant oil or acid expressed by the transgenic plant, and a transgenic non-human animal expressing elongase in its fluid. The nucleic acids and elongase proteins may be used directly or indirectly in the production of polyunsaturated fatty acids (pufa), for e.g. arachidonic acid, which can then be used nutritional compositions, pharmaceutical compositions, cosmetics and animal feeds. The pharmaceutical compositions way be used in the treatment of restenosis after angioplasty, AIDS (acquired immunodeficiency syndrome), multiple sclerosis, inflammatory skin diseases, osteoporosis, kidney or urinary tract stones, malignant cancer, cachexia associated with cancer, eczema, symptoms of inflammation, rheumatoid arthritis, asthma and psoriasis. They are also useful for inhibiting platelet aggregation, inducing vasodilation, reducing cholestersol, reducing or preventing anti-inflammatory drugs. The present sequence represents an elongase of the invention.

Isolated nucleic acid sequences encoding elongase proteins, useful in the production of polyunsaturated fatty acids, e.g. arachidonic acid, which can then be used nutritional compositions and pharmaceutical compositions (for treating AIDS) -

Example 21; Fig 74; 271pp; English.

The invention relates to isolated nucleic acid sequences encoding elongase proteins and the elongase proteins themselves. Also included are a purified polypeptide which elongates polyunsaturated fatty acids and has at least 30% amino acid similarity to the amino acid sequence to an elongase protein, a vector comprising the nucleic acid, a plant cell (or tissue or whole plant) comprising the vector and expressing the nucleic acid, a plant oil or acid expressing elongase transgenic plant, and a transgenic non-human animal expressing elongase in its fluid. The nucleic acids and elongase proteins may be used in the theorem of compositions, pharmaceutical compositions, cosmetics and animal feeds. The pharmaceutical compositions may be used in the treatment of restenosis after angioplasty, AIDS (acquired immunodeficiency syndrome), multiple sclerosis, inflammatory skin diseases, osteoporosis, kidney or urinary tract stones, malignant cancer, cachexia associated with cancer, eczema, symptoms of inflammation, rheumatoid arthritis, asthma and psoriasis. They are also useful for inhibiting platelet aggregation,

The nucleic acids and elongase proteins may be used directly or indirectly in the production of polyunsaturated fatty acids (pufa), for e.g. arachidonic acid, which can then be used nutritional compositions, pharmaceutical compositions, cosmetics and animal feeds. The pharmaceutical compositions may be used in the treatment of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Isolated nucleic acid sequences encoding elongase proteins, useful in the production of polyunsaturated fatty acids, e.g. arachidonic acid, which can then be used nutritional compositions and pharmaceutical compositions (for treating AIDS) -
 ation, reducing cholesterol, reducing or preventing bleeding and side effects of non-steroidal y drugs. The present sequence represents an elongase

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to isolated nucleic acid sequences encoding elongase proteins themselves. Also included are a purified polypeptide which elongates polyunsaturated fatty acids and has at least 30% amino acid similarity to the amino acid sequence to an elongase protein, a vector comprising the nucleic acid, a plant cell (or tissue or whole plant) comprising the vector and expressing the nucleic acid, a plant oil or acid expressed by the transgenic plant, and a transgenic non-human animal expressing elongase
restenosis after angioplasty, AIDS (acquired immunodeficiency syndrome), multiple sclerosis, inflammatory skin diseases, osteoporosis, kidney or urinary tract stones, malignant cancer, cachexia associated with cancer, eczema, symptoms of inflammation, rheumatoid arthritis, asthma and psoriasis. They are also useful for inhibiting platelet aggregation, inducing vasodilation, reducing cholesterol, reducing or preventing gastrointestinal bleeding and side effects of non-steroidal anti-inflammatory drugs. The present sequence represents an elongase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Isolated nucleic acid sequences encoding elongase proteins, useful in the production of polyunsaturated fatty acids, e.g. arachidonic acid, which can then be used nutritional compositions and pharmaceutical compositions (for treating AIDS) -

the production of polyunsaturated fatty acids, e.g. arachidonic acid, which can then be used nutritional compositions and pharmaceutical compositions (for treating AIDS) -

79; 271pp; English Example 21; Fig The invention relates to isolated nucleic acid sequences encoding elongase proteins and the elongase proteins themselves. Also included are a purified polypeptide which elongates polyunsaturated

sequence to an elongase protein, a vector comprising the nucleic sequence to an elongase protein, a vector comprising the nucleic acid, a plant oil or acid expressed by the transgenic plant, and a transgenic non-human animal expressing elongase in its fluid. The nucleic acids and elongase proteins may be used directly or indirectly in the production of polyunsaturated fatty acids (pufa), for e.g. arachidonic acid, which can then be used nutritional compositions, pharmaceutical compositions, cosmetics and animal feeds.

The pharmaceutical compositions may be used in the treatment of restenosis after angioplasty, AIDS (acquired immunodeficiency syndrome), multiple sclerosis, inflammatory skin diseases, osteoporosis, kidney or urinary tract stones, malignant cancer, cachexia associated with cancer, eczema, symptoms of inflammation, rheumatoid arthritis, asthma and psoriasis. They are also useful for inhibiting platelet aggregation, inducing vasodilation, reducing cholesterol, reducing or preventing gastrointestinal bleeding and side effects of non-steroidal anti-inflammatory drugs. The present sequence represents an elongase to the amino acid acid similarity of the invention

US-UB-359-696.

Sequence 2, Application US/08359696

Retent No. 563340

GENERAL INFORMATION:
Patent No. 563340

GENERAL INFORMATION:
Patent No. 70077, Jamie 8.

TITLE OF INVENTION: P-119 PROMOTERS AND THEIR USES
NUMBER OF SEQUENCES:
ADDRESSEE: Townsend and Townsend Khourie and Crew
STREET: Steuart Street Tower, One Market Plaza
CITY: San Francisco
STREET: Steuart Street Tower, One Market Plaza
CITY: San Francisco
STREET: California
COUNTRY: US
ZIP: 94.105-1493
COMPUTER: READABLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC compatible
OPERATION PATE: DS/08/359,696
FILING DATE: 20-DEC-1994
CLASSIFICATION NUMBER: US/08/359,696
FILING DATE: 20-DEC-1994
CLASSIFICATION NUMBER: 12.176-004800
TELEFORMUNICATION INFORMATION:
TELECOMMUNICATION INFORMATION:
TELEFORMUNICATION INFORMATION:
TELEFORMET: 110 amino acid
TYPE: amino acid
TYPE: amino acid
TYPE: Applicative Force:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Indels
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          DB 1;

RESULT 9
TO1975
hypothetical protein T9A4.9 - Arabidopsis thaliana (mouse-ear cress)
C; Species: Arabidopsis thaliana (mouse-ear cress)
C; Date: 26-Peb-1999 #sequence_revision 26-Feb-1999 #text_change 24-Mar-1999
C; Accession: T01975
R; Zidanic, M.; McQuerry, Y.; Smith, A.
submitted to the EMBL Data Library, October 1998
A; Description: The sequence of A. thaliana T9A4.
A; Reference number: Z14478
A; Accession: T01975
A; Scatus: translated from GB/EMBL/DDBJ
A; Accession: T01975
A; Scatus: Lanslated from GB/EMBL/DDBJ
A; Residues: 1-325 < ZID>
A; Man position: 4
A; Map position: 4
A; Introns: 62/3; 93/3; 156/3; 207/3

McCombie, W.R.

submitted to the EMBL Data Library, January 1999
A; Description: A. thaliana BAC T13116 from chromosome IV, top arm.
A; Reference number: Z14205
A; Status: translated from GB/EMBL/DDBJ
A; Status: translated from GB/EMBL/DDBJ
A; Molecule type: DNA
A; Residues: 1-292 <DEL>
A; Residues: 1-292 <DEL>
A; Cross-references: EMBL: AC003952; NID: g2708736; PID: g2708739

"Complete genomic sequence of the filamentous nitrogen-fixing

Tyanobacterium Anabaena sp. strain PCC 7120.";

DNA Res. 8:205-213(2001).

-:- FUNCTION: THIS PROTEIN IS A FE-MO-COFACTOR BIOSYNTHETIC

COMPONENT.

-:- CATALYTIC ACTIVITY: Acetyl-CoA + H(2)O + 2-oxoglutarate = 2-

hydroxybutane-1,2,4-tricarboxylate + CoA.

-:- SIMILARITY: Belongs to the alpha-IPM synthetase / homocitrate

synthase family.

                                                                                                                                                                                                                                                                           The phosphofructokinase from the yeast Yarrowia lipolytica.";

A Gancedo C.;

The phosphofructokinase from the yeast Yarrowia lipolytica.";

The phosphofructokinase from the EMBL/GenBank/DDBJ databases.

CC -!- CATALYTIC ACTIVITY: ATP + D-fructose 6-phosphate = ADP + D-fructose 1,6-bisphosphate (By similarity).

CC -!- PATHWAY: Key control step of glycolysis.

CC -!- SUBUNIT: Heterooctamer of 4 alpha and 4 beta chains (By similarity).

CC -!- SUBCELULAR LOCATION: Cytoplasmic (By similarity).

CC -!- SIMILARITY: Belongs to the phosphofructokinase family. Two domains cubfamily.

Submitted (DEC-2000) to the EMBL/GenBank/DDBJ databases.

--- FUNCTION: Involved in the biosynthesis of very long chain fatty
acids. Seems to represent a photoreceptor-specific component of
the fatty acid elongation system residing on the endoplasmic
the fatty acid elongation system residing on the endoplasmic
the fatty acid elongation system residing on the endoplasmic
ceticulum. May be implicated in docosahexaenoic acid (DHA)
alpha-linolenic acid and a subsequent series of three elongation
steps. May be involved in one of these three elongation steps.

--- SUBCELULAR LOCATION: Integral membrane protein. Endoplasmic
reticulum (Potential).

--- TISSUE SPECIFICITY: Expressed in the retina and at much lower
level in the brain.

--- TISSUE SPECIFICITY: Expressed in the retina and at much lower
level in the brain.

--- TISSUE SPECIFICITY: Expressed in the retina and at much lower
level in the brain.

--- TISSUE SPECIFICITY: Expressed in the retina and at much lower
level in the brain.

--- TISSUE SPECIFICITY: Expressed in the retina and at much lower
level in the brain.

--- SUBCELULAR degeneration characterized by decreased visual acuity,
macular degeneration characterized by decreased visual acuity,
macular atrophy, and extensive fundus flecks.

--- SIMILARITY: BELONGS TO THE ELO FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This SWISS-PROT entry is copyright. Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

ABZ71132 to ABZ71163 encode glycosylated kinamycins ABP57609 to ABP57640 isolated from Streptomyces murayamaensis ATCC 21414. Kinamycins are a class of type II polyketides. The kinamycins have antibacterial and cytostatic activities. They can be used for treating infections as antibiotics and as antitumour agents, and as electrophilic azo-coupling agents in vitro or in vivo.
                                                                                                                                                                                                      The invention relates to screening of inhibitors of alpha-synuclein aggregation in the presence of exogenous iron or copper. The inhibitors are magnesium and alpha-synuclein binding peptides, which are useful for treating neurodegenerative disease that involves the formation of Lewy bodies e.g. Parkinson's disease (PD), Alzheimer's disease (AD), diffuse Lewy body disease, mixed AD-PD, multiple system atrophy and Hallervorden-Spatz disease. The present sequence is a peptide that binds to the NAC (non-amyloid-beta protein component) portion of human alpha-synuclein and inhibits its aggregation.
synuclein useful for treating a neurodegenerative disease involves
determining aggregation of alpha synuclein in the presence of exogenous
iron or copper
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          lyketide used e.g. as antibiotic and antitumor agents ycin molecule comprising at least one saccharide group

   viral infections caused by HIV-1
conditions such as infections, such as viral infections caused by HIV-1 (human immunodeficiency virus) or HIV-2, pain, cancers, metabolic and cardiovascular diseases and disorders (e.g., type 2 diabetes, obesity, anorexia, hypotension, hypertension, myocardial infarction, atherosclerosis), Parkinson's disease, and psychotic and neurological disorders, including schizophrenia, migraine, major depression, anxiety, mental disorder, manic depression, and dyskinesias, such as Huntington's disease or Tourette's Syndrome and many other diseases and syndromes listed in the specification. nGPCR-x polynucleotides and polypeptides, as well as nGPCR-x modulators, may also be used in diagnostic assays for such diseases or conditions. The present sequence represents a G protein-coupled receptor of the invention.
                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ynucleotide and encoded polypeptides, useful in rensics, gene mapping, identification of mutations genetic disorders or other traits and to assess

                                                                                                                                                                                                                                                                             8
```

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity.
                                                                                                                                                                                                                                                                                                        ö
imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention.

Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; chromosome mapping; gene mapping; gene therapy; forensic; food supplement; medical imaging; diagnostic; genetic disorder.

```
The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations
                                                                                                                                                                                                                                     ö
The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention.

Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

The invention relates to isolated polynucleotide (I) and

polymerase chain reaction (PCR) primers, oligomers, and for chromosome

polymerase chain reaction (PCR) primers, oligomers, and for chromosome

condition and in recombinant production of (II). The

polynucleotides are also used in diagnostics as expressed sequence tags

condition are normal activity of (II) is useful in gene therapy techniques

condition a polypeptide in is useful in gene therapy techniques

condition a polypeptide in tissue, as molecular weight markers and as

donutitating a polypeptide in tissue, as molecular weight markers and as

condition and its binding partners are useful in medical

maging of sites expressing (II) (I) and (II) are useful for treating

disorders involving aberrant protein expression or biological activity.

The polypeptide and polynucleotide sequences have applications in

diagnostics, forensics, gene mapping, identification of mutations

responsible for genetic disorders or other traits to assess biodiversity

and to produce other types of data and products dependent on DNA and
                                                                                                                                                                                                                         ö
responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention.

Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                          Gaps

New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity

Claim 20; SEQ ID No 36043; 103pp; English.

The invention relates to isolated polynucleotide (I) and probes, polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The and in recombinant production of (II). The columniant of indentifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical chappeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations in diagnostics, forensics, gene mapping, identification of mutations in diagnostic amino acid sequences of the invention.

The polypeptide amino acid sequences of the invention.

New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity -

No 51994; 103pp; English. Claim 20; SEQ ID

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polypeptide (II) sequences. (I) is useful as hybridisation probes, and gene mapping, and in recombinant production of (II). The and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving to restore normal activity of (II) or to treating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical insping of sites expressing (II). (I) and (II) are useful in treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences of the invention.

The transcriptase is useful for studying the mechanisum of gene destruction or expression in Bacillus species.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ..

(first entry)

```
polymerase chain reserves. (I) is useful as hybridisation probes,

polymerase chain reaction (PCR) primers, oligomers, and for chromosome

and gene mapping, and in recombinant production of (II). The

and gene mapping, and in recombinant production of (II). The

polymucleotides are also used in diagnostics as expressed sequence tags

for identifying expressed genes. (I) is useful in gene therapy techniques

(II) is useful for generating antibodies against it, detecting or

(II) it is useful for generating antibodies against it, detecting or

(II) and its binding partners are useful in medical

maging of sites expressing (II). (I) and (II) are useful for treating

disorders involving aberrant protein expression or biological activity.

The polypeptide and polymucleotide sequences have applications in

diagnostics, forensics, gene mapping, identification of mutations

responsible for genetic disorders or other traits to assess biodiversity

and to produce other types of data and products dependent on DNA and

diagnostic amino acid sequences of the invention.

Note: The sequence data for this patent did not appear in the printed

specification, but was obtained in electronic format directly from WIPO

cat ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                            ynucleotide and encoded polypeptides, useful in ensics, gene mapping, identification of mutations genetic disorders or other traits and to assess
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity

Claim 20; SEQ ID No 49564; 103pp; English.

The invention relates to isolated polynucleotide (I) and probes, polypeptide (II) sequences. (I) is useful as hybridisation probes, polypeptide (II) sequences. (I) is useful as hybridisation probes, and gene mapping, and in recombinant production of (II). The and gene mapping, and in recombinant production of (II). The columniant production of (II). The columniant production of (II) is useful for generating antibodies against it, detecting or to restore normal activity of (II) or to treat disease states involving (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) a

The invention relates to isolated polynucleotide (I) and probes, polypeptide (II) sequences. (I) is useful as hybridisation probes, and gene mapping, and in recombinant production of (II). The and gene mapping, and in recombinant production of (II). The colynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques or restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and diagnostic amino acid sequences of the invention.

Comino acid sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

RESULT 15 ABG21601

The invention relates to isolated polynucleotide (I) and probes, polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The and gene mapping, and in recombinant production of (II). The colorides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques or restore normal activity of (II) or to reat disease states involving to restore normal activity of (II) or to restore normal activity of (II) and its binding partners are useful in medical a food supplement. (II) and its binding partners are useful in medical a food supplement. (II) and its binding partners are useful for treating of disorders involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in disorders involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations of and to produce other types of data and products dependent on DNA and diagnostic amino acid sequences of the invention.

Companies of the sequence of the invention of sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO cut the top of the sequences. Gaps New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity -.; 0 22; Length 478; 1; Indels 88.6%; Score 39; DB 85.7%; Pred. Sequence 22814, Application US/09252991A

Patent No. 6551795

GENERAL INFORMATION:
APPLICANT: Marc J. Rubenfield et al.
APPLICANT: Marc J. Rubenfield et al.
TITLE OF INVENTION:
TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
TITLE OF INVENTION: ABRUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
TITLE OF INVENTION: ASRUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS

CURRENT FILING DATE: 1999-02-18
PRIOR PELICATION NUMBER: US 60/094,190

PRIOR FILING DATE: 1998-07-27

NUMBER OF SEQ ID NOS: 33142

SEQ ID NO 22814

LENGTH: 172
